Hello, anyone knows the manufacturer of this product A: I have the same device. The text is a bit difficult to read but it is just a serial number. Identification of a novel biofilm-specific outer membrane protein from Listeria monocytogenes. To examine the contribution of outer membrane proteins to biofilm formation in Listeria monocytogenes. Three strains of L. monocytogenes with diverse biofilm-forming abilities were examined. Biofilm assays, proteome analysis and immunodetection of outer membrane proteins were performed. A novel, biofilm-specific, outer membrane protein of L. monocytogenes was identified. Mutations of the putative lipoprotein and two lipoproteins not previously shown to be associated with biofilm formation strongly reduced the ability to form biofilms. The protein was shown to be highly expressed at the cell surface by immunodetection. These results indicate that the lipoprotein encoded by the bopA gene is a biofilm-specific, outer membrane protein involved in the initial attachment of L. monocytogenes to a surface.Q: Difference between running a program from xcode or terminal I have installed Ubuntu 12.04 in my mac and have started using xcode. When I create a new project, open a file and compile the code and run it I get a prompt and have to enter a password. Is there a way to run the code in terminal without having to do this everytime I run the code? A: If you have a file /Users/your-username/Desktop/login.sh then you can run that script just typing ./login.sh. You can run a script (in ubuntu) from the command line if you put it in one of the following directories: /etc/profile /etc/bash.bashrc Or if you want to run a script everytime you start Xcode or other IDE you can add it to ~/.bashrc If you want to execute a script everytime you start your computer you can use crontab. To add a cron job run the command crontab -e. Now to add a command execute the command crontab -e and add the command you want to execute like this: @reboot ~/Desktop/login.sh @reboot ~/Desktop/login. 54b84cb42d
