The light-colored proteins expressed in malaria-infected red cells have been purified from malarial extracts and antigenic analyses are in progress to determine whether they are related to gametocyte antigens. They may play a role in modifying the host response to the parasite. With respect to *Vibrio cholerae* infection of humans, a clear relationship between the severity of the disease and the level of vibriocidal antibody is seen. Sera from patients with severe disease do not recognize an antigen of the O1 Inaba vibrios but do react with a toxin (cholera toxin) produced by the toxigenic O1 El Tor strains. Studies of specific immune

responses in cholera are in progress. The patients with most severe disease have antibody and T lymphocyte responses which are directed to the toxin. On the other hand, the patients with mild or moderate disease have greater responses to the specific polysaccharide of the O1 El Tor Inaba strain. Studies are in progress to determine if the patients with intermediate levels of antibody recognize antigens that are produced by both the toxigenic and nontoxigenic forms of the organism.// Copyright (c) 2016 Uber Technologies, Inc. // // Permission is hereby granted, free of charge, to any person obtaining a copy // of this software and associated documentation files (the
