1. \*\*Create a new document.\*\* 2. \*\*Open an image file you wish to manipulate.\*\* See Chapter 6 for instructions on opening a file. 3. \*\*Select the Layers palette, and make sure the Background layer is highlighted.\*\* 4. \*\*Create a new layer by pressing Ctrl+Shift+N or clicking the button in the Layers palette.\*\* Figure 7-9 shows the Layers palette with a Background layer active and the New Layer button selected. By default, the background layer will be inserted into the new layer. You can choose to place a new layer on top of the active layer, insert the new layer to the same position as the active layer, or place the new layer to the bottom of the layers. In this illustration, the new layer has been placed on top. 5. \*\*Optional: If you like, use the Move tool or the Selection tool to draw a selection around the image.\*\* 6. \*\*In the Layers palette, double-click the Background layer to activate the layer.\*\* 7. \*\*After some minor editing, click OK to complete the operation.\*\* Figure 7-9: Use the Layers palette to place a new layer above the active layer. With the layers active in Figure 7-10, the image has been modified. Figure 7-10: Simple changes were made to an image by using the Selection tool to create a path around objects in the image. 8. \*\*To edit the image, click anywhere in the canvas.\*\* Photoshop opens the Layers palette and displays a list of layers. 9. \*\*Adjust the individual layers using the tools provided.\*\* 10. \*\*Save your image.\*\* Using Photoshop to create, manipulate, and save images requires the following steps: 1. \*\*Create a new document.\*\* See Chapter 6 for instructions on opening a file. 2. \*\*Choose File⇒New.\*\* 3. \*\*Select Photoshop from the file type list.\*\* Photoshop opens and begins to import the file you've just opened. 4. \*\*After the import completes, highlight the Background layer.\*\* Photoshop selects the layer, which is located in the layers palette by default. 5. \*\*Click OK in the Layers palette, which resets the Background layer to its default settings.

The Healing Brush is the most commonly used tool in Photoshop for image editing. With it, you can clear up those nicks, blemishes, and other imperfections in an image. The Magic Wand Tool lets you quickly select areas of any color in an image, even if you know little about Photoshop. You can also use the Selection Brush or the Elliptical Selection Brush to define more specific shapes in an image. The Pen Tool is typically used for drawing on top of an image. It can also be used for special effects, like painting with oils. The Lens Blur Filter can help blur the edges of an image. The New Filters feature offers a plethora of different filters and effects that are available to the user. These include: the Bevel & Emboss filter, the Blur filter, the Color Splash filter, the Emboss filter, the Free Transform filter, the Gradient tool, the Lighting Effects filter, the Lens Blur filter, the Noise filter, the Original Filter, the Soften filter, the Vignette filter, the Warp tool, the Wipeout filter and the Watercolor filter. Additionally, the following topics are covered in this book: Photoshop Elements has some of the same features as Photoshop, but also many unique tools and filters. Some of the most common features include the following: The Fill Tool can replace or erase individual pixels. This feature is useful for fixing small problems in images. The Photo Filter lets you replace or adjust an existing photo's color or tone. The Spot Healing Tool allows you to remove spots, blemishes, or unwanted objects from an image. The Spot Healing Brush selectively erases image elements like groups of pixels, groups of colors, or groups of spots and blemishes. The Crop Tool makes it easy to remove selected areas from an image. The Adjustment Layers feature makes it easy to apply effects or filters to entire image areas. The Spot Healing Brush allows you to selectively erase areas of an image that have been selected by using a brush. The Clone Stamp tool automatically creates copies of an area of an image and pastes them into another area. This is useful for making images look better. The Bitmap Masks feature lets you mask selected parts of an image. You can also work with channels, layers, and paths. The Gradient tool lets you create and apply gradients to individual parts of an image. The Gradient filter lets you make images look like

1. Field of the Invention This invention relates to an ignition timing control system for an internal combustion engine, and more particularly to a control system wherein the ignition timing is controllably retarded from a reference timing for decreasing the amount of NO.sub.x produced. 2. Description of the Related Art The NO.sub.x, which has been considered as a nuisance air polluting substance in the recent automotive engine development, is a collection of nitrogen monoxide (NO) and nitrogen dioxide (NO.sub.2) discharged together with soot at the combustion chamber of the engine. The NO.sub.x is produced mainly as a result of combustion of lean air-fuel mixture or under the high temperature conditions due to the backward movement of the flame front of the air-fuel mixture ignited by compression heating. In order to reduce the production of NO.sub.x or at least delay it, there have been proposed various kinds of NO.sub.x control systems for an internal combustion engine. The prior art NO.sub.x control systems have utilized a basic characteristic that the greater the retardation of ignition timing, the more significant is the effect in reducing NO.sub.x. That is, while the engine is operating with lean air-fuel mixture, the ignition timing is delayed to the lower end of the compression stroke, with the best NO.sub.x reducing effect. Therefore, the ignition timing is gradually retarded with the lapse of time, thus gradually increasing the ratio of the rich air-fuel mixture to the lean air-fuel mixture. However, as shown in FIG. 5, when the engine is operating with, for example, rich air-fuel mixture, the optimum ignition timing (ON.sub.O timings) for the minimum amount of NO.sub.x is at a timing different from that for the minimum amount of HC or power. Furthermore, the optimum NO.sub.x reducing timing for an engine with a low engine speed is at a timing which is too early for the minimum amount of HC or power as shown in FIG. 6. These facts are well known in the art and there are reported in several publications. The above-mentioned prior art systems are calculated and controlled by a program which utilizes certain output to minimum of NO.sub.x and HC or power. The result of the calculation is then supplied to the control circuit. However, in an actual engine having a plural number of cylinder, and even in a single cylinder engine, because the optimum
